Cooperative effects are investigated in molecularly well-defined systems (represented by a frustrated Lewis acid-base pair, lower right), in biological systems using chemical tools (exemplified by two chemically interlinked proteins, upper left), and in nanoparticle and surface science (demonstrated for a ligand-bound surface, upper right).

Molecular binding is an interaction between molecules that results in a stable physical association between those molecules. Cooperative binding occurs in binding systems containing more than one type, or species, of molecule and in which one of the partners is not mono-valent and can bind more than one molecule of the other species. For example, consider a system where one molecule of species A can bind to molecules of species B. Species A is called the receptor and species B is called the liga
