Hydraulic Training Axial Piston Units

Axial piston units are self-priming; in certain special cases, however, a low pressure is applied to the suction side. In open circuit hydraulic fluid is fed to the user via directional control valves and returned to the tank in the same way. Typical features of the open circuit are: n suction lines - short length, large diameter

Hydraulic-Training Axial Piston Units Basic Principles

Axial piston pumps typically have 9 pistons that rotate around a central drive shaft. As the pistons rotate they move against a washplate or bent axis which forces them to move up and down along the pump axis. As the pistons retract they allow fluid, under the reservoir pressure head, to fill the increasing volume.

Axial piston pumps are used to power the hydraulic systems of jet aircraft, being gear-driven off of the turbine engine's main shaft. The system used on the F-14 used a 9-piston pump that produced a standard system operating pressure of 3000 psi and a maximum flow of 84 gallons per minute.

This article is a follow up, focused on a piston assembly of a swashplate type axial piston pump. The pictures show a classic piston shoe design, although the hydraulic balance principle is equally applied to the "inverted" piston design, where the "ball" is part of the shoe (Linde, Komatsu.), the solution that allows a bigger swash-plate angle and therefore a more compact pump design.

Hydraulic Pump/Motor Division In this view the variable orifice is restricting pump flow . Pump outlet pressure is increased and a pressure drop is created across the orifice. The pump pressure will increase until it overcomes the differential spring force and shifts the spool to direct control oil into the servo piston and destroke the pump. The

The displacement in a radial hydraulic motor is a function of the total piston area as well as the eccentricity of the track ring. Radial motor applications are generally limited to higher horsepower units. Axial piston motors In an axial piston motor, the rotor rotates on the same axis as the pistons. There are basically two types of axial piston motor design.
