The alkali metals consist of the chemical elements lithium (Li), sodium (Na), potassium (K), rubidium (Rb), caesium (Cs), and francium (Fr). Together with hydrogen they constitute group 1, which lies in the s-block of the periodic table. All alkali metals have their outermost electron in an s-orbital: this shared electron configuration results in their having very similar characteristic properties.

### Alkali metal - Wikipedia

Porous materials with a narrow distribution of pore sizes, especially in the angstrom range (1–5), are of interest for use in separation technologies (5–7). The observation of fast permeation of water through carbon nanotubes (8–10) and, more recently, through graphene-oxide (GO) laminates has led to many proposals to use these materials for nanofiltration and desalination (8–19).
